Command-Node Persistence Theory

A Perspectival Aspect Architecture of Command, Maintenance, Orientation, Macro
Formation, Fragmentation, and Collapse

Elad Genish

Final Integrated Edition

30 July 2026

Everything that holds is holding against something.

A unified theoretical statement

Abstract

Command-Node Persistence Theory (CNPT) is a general architecture for analysing how objects persist under what bears on them. It begins from one base term, **object**, and treats node, command, structure, frame, world, orientation, utility, micro, and macro as aspect-positions rather than separate kinds of entity. An object is node from its own maintenance position. The same object occupies command-aspect when it bears survival-relevantly on another object's maintained function. It occupies structure-aspect as a standing form, frame-aspect as a reader, world-aspect as something encountered from a focal node, and micro- or macro-aspect according to the direction of maintenance.

The theory's central mechanism is **command-shape**. When command bears on a node, the resulting shape is relationally determined through the physiologies that meet. The focal node carries that shape either directly in its own physiology or through a structure it builds, finds, or uses. Maintenance holds the resulting form. Command therefore does not simply arrive, produce an answer, and disappear. Its bearing survives in present organisation: in a scar, posture, routine, timetable, category, border, institution, or conceptual distinction. History matters where it remains active as current physiology or structure.

Orientation and utility describe the same functional relation from different positions. Orientation is the object's total real-time position against command from its own side. Utility is that function read from another object's frame. Neither reading is neutral, and neither is freely assigned. Each is constrained by the actual physiologies, functions, command relations, and maintenance levels involved.

CNPT then explains how local persistence scales. Related objects can independently converge on, transmit, retain, and standardise survivable forms. A higher macro object forms when lower objects and relations jointly maintain a field-level function with its own physiology, orientation, and command-world. The macro object can then return through structures that become command for the lower worlds maintaining it. This recursive architecture grounds CNPT's accounts of growth, stability, hollow stability, recognition, power, displaced maintenance cost, correction, collapse, and fragmentation.

Persistence is not the absence of command. It is the maintained carrying of command in shape.

Figure 1. The core CNPT persistence architecture.

Architectural Statement

CNPT is one connected architecture, not a list of independent claims. Its terms form a single dependency:

```
object -> aspect-position -> command relation -> command-shape -> maintenance -> functional
continuity -> changed future relations
```

The smallest directional relation is:

```
B[command] -> A[node]
```

The full persistence relation is:

```
command bears on node -> shape is determined -> physiology or structure carries the shape ->
maintenance holds it -> the retained form conditions what can happen next
```

The theory can be compressed into one sentence:

An object persists when its own maintenance continues to hold its function through physiology or structure shaped by the commands that bear on it.

Every later concept in CNPT specifies a position, level, consequence, or recursion inside this relation.

Table of Contents

1. Introduction	6
2. Object and Aspect	7
2.1 Object as the base term	7
2.2 Aspect-positions	7
2.3 Node	8
2.4 Command	8
2.5 Structure	8
2.6 Frame	8
2.7 World	8
2.8 Orientation and utility	9
2.9 Micro and macro	9
3. Physiology, Function, Identity, Maintenance, and History	10
3.1 Physiology	10
3.2 Function	10
3.3 Identity	10
3.4 Maintenance	10
3.5 History as active structure	11
4. Encounter, Direction, and Command-Shape	12
4.1 Directional encounter	12
4.2 Relational determination	12
4.3 Two routes of bearing	12
4.4 From bearing to changed future	13
5. Time, the Unfinished Whole, Potential, and Command Persistence	14
5.1 The unfinished whole	14
5.2 Potential	14
5.3 Before, during, and after	14

5.4 Persistence of command	14
6. World, Orientation, Utility, and Growth	16
6.1 Command-world	16
6.2 Orientation	16
6.3 Utility	16
6.4 The orientation-utility relation	16
6.5 Growth	17
7. Retention, Convergence, Standardisation, and Macro Formation	18
7.1 Retention	18
7.2 Similar problem-spaces	18
7.3 Parallel convergence and transmission	18
7.4 Resemblance is not macro formation	18
7.5 Macro return	19
7.6 Recursive maintenance	19
8. Stability, Hollow Stability, Collapse, and Fragmentation	20
8.1 Stability	20
8.2 Hollow stability	20
8.3 Collapse	20
8.4 Fragmentation	21
8.5 Re-anchoring	21
9. Recognition, Power, and Displaced Maintenance Cost	22
9.1 Recognition	22
9.2 Power	22
9.3 Displaced maintenance cost	22
9.4 Power and visibility	22
10. Correction, Delusion, and Reflexivity	24
10.1 Correction	24
10.2 Delusion	24
10.3 Reflexive application	24

14. Final Synthesis 33

Glossary 34

1. Introduction

A body holds against hunger, injury, fatigue, temperature, desire, and time. A school holds against disorder, inspection, funding limits, legitimacy demands, and the difficulty of coordinating people. A theory holds against contradiction, evidence, rival descriptions, and misuse. A state holds against pressures distributed across law, territory, money, population, force, infrastructure, and recognition.

CNPT is a theory of that holding: how an object persists under what bears on it, how bearing becomes retained in form, how maintenance is distributed across levels, and what it means when the holding changes or fails.

The framework does not begin by dividing reality into fixed ontological classes. It begins from **object** and asks how the same object stands in different relations. From its own maintenance position, the object is node. As survival-relevant bearing-on another, it is command. As a held form, it is structure. As a reader, it is frame. As encountered from a focal node, it is world. Orientation and utility are positional readings of function. Macro and micro are positions in a maintenance relation rather than measures of physical size.

This makes CNPT a meta-architecture: a grammar for describing persistence across physical, biological, psychological, social, institutional, and conceptual cases without claiming that those cases share one material substrate. The architecture is general; every application remains specific. A valid analysis must identify the object, function, level, direction of command, physiology, maintenance relation, and relevant frame. CNPT is therefore perspectival, but it is not permissive. The analyst does not create aspect-positions by naming them. The relation must support the reading.

The phrase **survival-relevant** is also level-specific. It does not always mean biological life. It means relevant to the continuation of the function specified in the analysis. Contradiction can be survival-relevant to a theory. Derecognition can be survival-relevant to a legal identity. Funding withdrawal can be survival-relevant to a school. A minor physical contact may be irrelevant to all three and therefore occupy no command-aspect in those relations.

CNPT uses the language of a **command-field** or **command topology** to describe the organised set of command relations currently bearing on a focal node. This is a derived map of relations, not a pre-given background, universal law, or hidden arena that exists before the objects. The topology changes when the objects, functions, levels, or relations change.

The dynamics of CNPT should not be reduced to a generic feedback loop. Command is not merely a signal that disappears after processing, and the node does not answer it and return to neutrality. Command is borne. The node's physiology takes command-shape directly, or the node builds, finds, or uses structure that bears that shape. If the form continues, maintenance continues to carry the bearing. The past survives where it remains organised into the present.

The same architecture scales. Similar objects facing related problem-spaces can converge on similar forms. Forms can be transmitted, borrowed, imposed, retained, or standardised. Where lower objects and relations jointly maintain a field-level function, resemblance becomes a higher macro object. That object develops its own orientation and can bear downward on the lower worlds maintaining it.

The remainder of the theory follows that movement from aspect-position to encounter, shape, time, orientation, retention, macro formation, power, and collapse.

2. Object and Aspect

2.1 Object as the base term

CNPT uses **object** as its minimal primitive. An object is whatever can stand as one within relations at the level being analysed. A rock, body, school, law, identity, theory, state, record, routine, role, or border may each be treated as object when its unity and persistence are the focus.

This is not a claim that every object has the same substance. CNPT does not ground objecthood in matter, energy, information, consciousness, language, or intention. It asks what is holding as one, what function is at stake, what maintains that function, and what bears on it.

Nor is objecthood merely an analyst's convenience. The proposed unity must be answerable to the relations under analysis. If no coherent function, physiology, maintenance, boundary, or consequence can be identified at the stated level, the object-reading has not been established.

2.2 Aspect-positions

Node, command, structure, frame, world, orientation, utility, micro, and macro are not additional entities placed beside the object. They are aspect-positions occupied by objects in relations.

Aspect	Position of the object	Governing question
Node	The object from its own maintenance side	What function is at stake for this object?
Command	The object as survival-relevant bearing-on another	What does this object force, constrain, or reorganise?
Structure	The object as a standing maintained form	What shape is held across time?
Frame	The object as reader of another	From what position is function being read?
World	The object as encountered from a focal node	How does this object enter the node's command-field?
Orientation	Function read from the object's own side	What is its total resolved position under actual command?
Utility	The same function read from another frame	How does that frame read the function's work or viability?
Micro	The object as contributing to another object's maintenance	What does it help hold?
Macro	The object as maintained by lower objects or relations	What field-level function is being held?

The same object can occupy several aspects at once. A school is node from its own side, structure as a standing institution, command where it bears on a student, frame where it reads the student, macro relative to classrooms and routines maintaining it, and micro relative to an education system it helps sustain.

Changing aspect changes the relational position from which the object is read. It does not multiply, replace, or dissolve the object.

2.3 Node

The node is the object from its own maintenance position: the side from which its function is at stake.

Every object is node from its own side. Nodehood does not require consciousness, language, intention, or reflective awareness. "Own side" names a maintenance position, not a private mental viewpoint. A rock has nodehood because its held form can persist, shift, fracture, erode, or cease to hold. A school has nodehood because school-function can be maintained, reorganised, or lost. A theory has nodehood because its distinctions and explanatory function can hold, change, or collapse.

2.4 Command

Command is the object as survival-relevant bearing-on another object's maintained function.

Command need not be spoken, intended, conscious, personal, legal, or externally imposed in the everyday sense. Hunger, gravity, debt, pain, a deadline, recognition, misrecognition, a law, a timetable, a parent, a border, a market, an injury, or a contradiction can each occupy command-aspect.

Not every contact is command. Contact becomes command only where it bears on what the focal node is maintaining itself as at the stated level. The same object can be command in one relation and irrelevant in another.

Command is directional. $\text{Command}(A, B)$ and $\text{Command}(B, A)$ are distinct relations even when both occur in one encounter. Reciprocity does not imply symmetry. Two objects may command one another while carrying radically unequal exposure, effect, and maintenance cost.

2.5 Structure

Structure is the object as a standing maintained form that carries command-shape.

Structure is static from outside at the relevant level and maintained from inside. Static does not mean absolutely motionless. It means the object reads as one held form while lower maintenance worlds carry the activity that keeps it standing. A timetable can remain the same while teachers, databases, rooms, clocks, habits, and sanctions continually reproduce it. A body can retain posture while muscle, pain, memory, and compensation maintain it.

2.6 Frame

Frame is the object as reader of another object from a position outside that object's own side.

A frame is not a view from nowhere. It is another object reading from where it stands. A school frames a student. A state frames a citizen. A doctor frames a body. A theory frames a case. CNPT occupies frame-aspect whenever it analyses an object.

"Reading" does not require conscious interpretation. A legal system, admissions procedure, measurement device, institution, or market can sort and respond to function without possessing reflective awareness. What matters is that the frame's position makes a functional distinction with consequences.

2.7 World

World is object as encountered from a focal node's survival position within a command-field.

World is not a neutral environment placed outside the node. It is the outward field as it actually bears, can bear, or becomes relevant to the node's function. Different nodes can therefore occupy the same physical location while inhabiting different command-worlds.

The node and world are not sealed compartments. The node is also object in the worlds of others, and objects encountered as world retain their own nodehood.

2.8 Orientation and utility

Orientation and utility are not two components added together. They are two positional readings of function.

Orientation is the object's total real-time position of physiology against actual command from its own side.

Utility is the same functional relation read from another object's frame.

Orientation is not belief, mood, intention, narrative, or a hidden programme. Utility is not a context-free score and is not automatically more objective. Both are relationally constrained. The distinction is between own-side and frame-side reading, not between subjective error and objective truth.

2.9 Micro and macro

Micro is the object as what maintains another object or field. Macro is the object as what is maintained by lower objects or relations.

Macro and micro do not mean large and small. They are local positions in a maintenance relation. A person can be macro relative to organs and micro relative to a school, family, firm, or state. A school can be macro relative to classrooms and micro relative to an education system. The same object may occupy both positions at once in different relations.

There is no universal ladder of levels. Macro relations can be nested, crossed, or looped. The relevant level is determined by the function and maintenance relation under analysis.

Objects do not belong to aspects. Objects occupy aspects, and the relation determines which reading holds.

3. Physiology, Function, Identity, Maintenance, and History

The aspect architecture identifies positions. The next terms explain what holds from the object's inside.

3.1 Physiology

Physiology is the node-side organisation through which an object takes shape, holds function, and meets command.

Physiology is not restricted to biology. A school's staffing, routines, records, material arrangements, authority relations, categories, and habits can belong to school-physiology. A theory's distinctions, inferential dependencies, exclusions, examples, and methods can belong to theory-physiology. A state's institutions, legal relations, records, infrastructure, revenue systems, and force can belong to state-physiology.

Physiology is not another aspect. It names the organised inside of the object from its node position.

3.2 Function

Function is what an object maintains itself as at the level under analysis. It is the maintained doing or being that makes the object that object in the specified relation.

Function is not identical to matter, label, appearance, externally assigned purpose, or conscious intention. A building can remain while school-function disappears. A text can remain while theory-function disappears. A person can continue performing a role after the role no longer holds from their own side, or can maintain an identity-function that a hostile frame refuses to recognise.

An object may hold several functions across overlapping fields. CNPT therefore requires function and level to be named before identity, stability, utility, or collapse is judged.

3.3 Identity

Identity is continuity of function at the relevant level.

Identity is not reduced to unchanging substance. Physiology can alter while function continues, and appearance can continue while function changes. The question is whether the specified object is still being maintained as the specified object in the specified relation.

This account allows overlapping identities without collapsing them. Body, person, citizen, employee, student, family member, and self-maintained identity can be related but distinct functions held in different worlds.

3.4 Maintenance

Maintenance is the ongoing node-side holding of command-shaped physiology or structure through which function continues.

Maintenance can be biological, social, symbolic, legal, cognitive, institutional, emotional, material, technical, conceptual, or practical. The form of maintenance depends on the object and world being analysed.

Maintenance is usually distributed and only partly visible. A person does not know every cellular process maintaining the body. A school-field does not know every student or teacher cost that holds it. A state does not know every household burden that keeps it functioning. A theory does not know every assumption that lets its distinctions continue to work.

Maintenance does not mean the command has been defeated. It means a command-shaped form is still being held.

3.5 History as active structure

CNPT does not require a separate historical substance or archive inside the object. History matters where earlier bearing survives as active present organisation.

A scar is earlier injury maintained in current physiology. A routine is earlier disorder, demand, or learning carried in present action. A border is movement, conflict, law, and classification retained as structure. A theoretical distinction is earlier contradiction or explanatory pressure preserved in conceptual physiology.

Not everything that happened survives. What survives is what remains active in physiology, structure, maintenance, or the command-world generated by them. The past is therefore selective without requiring a separate selector: only retained form continues to condition the present.

These terms form one relation:

function names what continues
physiology names the node-side organisation through which it can continue
maintenance names the holding that keeps it continuing
structure names the standing form in which that holding is visible
history names earlier command where it remains active in present form

4. Encounter, Direction, and Command-Shape

4.1 Directional encounter

Consider two objects, A and B. Both are nodes from their own sides. Both have physiology. Their encounter can be read directionally.

From A's position, B occupies command-aspect where B bears survival-relevantly on A:

```
B[command] -> A[node]
```

From B's position, A may simultaneously occupy command-aspect:

```
A[command] -> B[node]
```

These are not contradictory accounts. They are the same encounter read from opposite maintenance positions. Each relation must be specified independently.

The analyst must also distinguish the object-frame, observer-frame, and contact relation. The focal object's own orientation is not identical to an observer's utility reading, and the observer is itself an object with a position, physiology, and command-world. Observation can become command where the act of reading bears on the object being read.

4.2 Relational determination

The shape produced in an encounter is not contained in either object alone. It is determined through the relation between the physiologies that meet.

A rock resting on ground is not the ground. Yet the ground is present in the rock's maintained position and shape. The rock's weight is likewise present in the compressed or displaced ground. Each object carries the other according to its own physiology.

CNPT distinguishes object-side determination from frame-side calculation. The rock and ground do not need to calculate. Their physiologies determine what their contact can force. A geologist, mathematical model, or other frame may calculate or derive that determination.

The command reveals a determinate shape within the encounter, but it does not invent the space of possible shapes from nothing. The physiologies entering the relation constrain what can be forced, endured, redirected, recruited, or lost.

4.3 Two routes of bearing

When command bears on node, the command must be carried through shape. There are two routes relative to the focal node.

Direct physiological bearing: the focal node's own physiology takes command-shape. The command reshapes, erodes, trains, wounds, bends, sensitises, or reorganises the node directly.

Mediated structural bearing: the focal node builds, finds, or uses a structure that bears command-shape. A timetable, rule, record, distinction, routine, institution, border, role, treatment, shelter, or tool can carry the bearing.

The routes can combine, but they are not identical. A person can carry stress in bodily tension while also using a schedule to bear part of the same command. A school can reorganise staff culture while building new reporting systems. A theory can alter its distinctions while recruiting a formal notation.

Existing structure matters. The node does not need to create every solution from nothing. It can find or use forms already maintained elsewhere. Technology is important in this sense: it changes

the relation between node and world by extending the range of command-shapes that can be carried. A coat, database, vehicle, medicine, legal instrument, or conceptual tool can make a previously fatal, exhausting, or impossible command bearable.

There is no universal "answer" entity inserted between command and structure. A spoken answer is one possible structure in a human case. In the general architecture, the transition is simply the relational determination and carrying of shape.

4.4 From bearing to changed future

The immediate consequence of command is not only a local state change. A maintained command-shape changes what later commands encounter.

A trained muscle, learned avoidance, legal category, institutional procedure, damaged joint, hardened border, or refined concept alters the physiology or structure through which subsequent command will be borne. Present maintenance therefore modifies future possibility.

This gives CNPT its recursive engine:

```
command -> command-shape -> maintained form -> altered future command relation
```

The recursion does not require the retained structure automatically to become command. It becomes command only where it later bears survival-relevantly on another function. Its continued existence is enough to change the field of possible relations.

5. Time, the Unfinished Whole, Potential, and Command Persistence

5.1 The unfinished whole

Before a particular encounter is forced into a determinate command-shape, the physiologies involved already constrain a range of possible forms. CNPT calls the encounter under this indeterminacy the **unfinished whole**.

The unfinished whole is not merely the temporal stage called "before." It is the relation read under unresolved form. A relation can remain unfinished while already operating, because enough organisation may exist for the objects to act as one encounter while the exact shape remains incomplete.

Formally, if $P(A,B,L,t)$ is the set of shapes compatible with the physiologies of A and B at level L and time t, the unfinished whole is the encounter considered under P before one actual command-shape is resolved. It is a modal position inside the relation, not a separate object.

5.2 Potential

Potential names shapes fixed by the physiologies involved but not yet forced through actual command.

Potential does not enter orientation. Orientation is the node's resolved position under actual bearing in real time. Potential is a frame-side derivation from what the objects' physiologies make possible.

This distinction prevents future possibility from being confused with present node-side organisation. A frame may correctly identify many possible outcomes while the node occupies only one actual orientation.

5.3 Before, during, and after

The actual bearing of command gives a temporal sequence:

- 1 **Before:** the command-shape has not yet been forced in this encounter.
- 2 **During:** command bears on node and a shape is being resolved.
- 3 **After:** the bearing is carried in changed physiology or maintained structure.

These temporal phases and the unfinished whole answer different questions. Before, during, and after locate the event in time. The unfinished whole describes the relation under unresolved form.

5.4 Persistence of command

The command does not vanish when borne. Its bearing persists through the shape taken in physiology or structure.

A scar carries injury. A routine carries earlier disorder. A border carries movement, conflict, and classification command. A timetable carries coordination command. A theoretical distinction carries contradiction or explanatory pressure.

This does not mean the original commanding object remains physically present or that every detail of the encounter is preserved. What persists is the command as an organised consequence in the focal object's present form. Retention can be partial, compressed, transformed, or distributed across levels.

Command persistence therefore gives time a material or structural presence without turning history into a separate store. Earlier bearing remains causal where it is still being maintained.

The past survives in CNPT only where it is still holding something now.

6. World, Orientation, Utility, and Growth

6.1 Command-world

For a focal node N maintaining function F at level L and time t , its active command-world is the set of objects and relations that bear survival-relevantly on that continuation.

The organisation of those relations is the node's command topology. It is derived from active object relations. It is not a background field, pre-given constraint system, or universal law outside the objects.

The command-world is always focal. A deadline can dominate a student's world while remaining irrelevant to a passer-by. A legal classification can dominate a citizen's access while not appearing in another person's immediate physiology. The physical surroundings can be shared while the command-worlds differ.

6.2 Orientation

Orientation is the node's total resolved own-side position of physiology against its actual command-world.

Orientation is not a stage that processes input and produces output. It is the current organised position from which the object holds, moves, changes, and maintains itself. There is no second coherence logic hiding behind orientation.

If command changes, orientation changes. If physiology changes, orientation changes. A small command shift may produce a small orientation shift; a severe, accumulated, or strategically placed command can reorganise the object's whole direction.

Orientation can include conscious belief in a reflective node, but it is not reducible to belief. A body's posture, an institution's allocation pattern, or a theory's inferential direction can express orientation without requiring a private narrative.

6.3 Utility

Utility is the same functional relation read from another object's frame.

A doctor reads body-function. A school reads student-function. A state reads citizen-function. A theory reads a case. Each utility reading is positional and depends on the frame's physiology, function, command-world, and relation to the focal object.

Some frames are constitutive of a field-held function. A university's recognition may participate in maintaining student-function in the university field. Other frames are merely observational. A stranger's opinion normally does not constitute that function.

Utility is therefore neither a universal score nor an automatic authority. To state a utility claim is to specify whose frame is reading which function at which level and with what maintenance consequence.

6.4 The orientation-utility relation

Orientation and utility are not competing descriptions of separate parts. They are the same function read from two sides.

The object's orientation can hold while a hostile frame reads low utility. A frame can read high utility while the object's own maintenance is collapsing. These divergences are not errors in the

architecture. They are precisely what makes recognition, hollow stability, and displaced maintenance cost analysable.

Because frames are objects, their readings can also be corrected by further command. No frame is outside reality.

6.5 Growth

Growth is orientation moving into retained physiology or structure.

Growth is not synonymous with size, surplus, expansion, improvement, or moral good. An orientation grows when its resolved position becomes more deeply carried in the object's organisation or in structures that extend it.

Growth can strengthen maintenance, damage lower worlds, thicken a macro field, produce hollow stability, or contribute to collapse. A defensive institution can grow more defensive. A harmful habit can grow more structurally secure. A theory can grow by clarifying its distinctions, or grow in a distorted direction by building protection against correction.

The criterion is not "more" in the abstract. It is the movement of orientation into maintained form.

7. Retention, Convergence, Standardisation, and Macro Formation

7.1 Retention

Retention occurs when a command-shaped form remains maintained after the immediate bearing that produced it.

Retention is not a separate operator. It is maintenance viewed across time. What is retained can be physiological, material, symbolic, legal, institutional, behavioural, or conceptual.

Retained forms alter later encounters. They make some commands easier to bear, others harder, and some newly possible. They can also be observed or recruited by other nodes.

7.2 Similar problem-spaces

Similar objects often face overlapping command-worlds. Schools educating comparable age groups face recurring problems of time, attendance, coordination, teaching, assessment, funding, legitimacy, and regulation. Their physiologies and local worlds are not identical, but their problem-spaces overlap.

Related functions under related commands can therefore produce related orientations and survivable forms.

7.3 Parallel convergence and transmission

Similar forms can emerge through at least two routes.

Parallel convergence: different objects independently develop similar forms because their physiologies orient against related command-worlds.

Transmission: a form maintained in one object is observed, copied, borrowed, required, taught, purchased, inherited, or otherwise taken up by another.

The routes can combine. A transmitted form may be locally altered because the receiving node has a different physiology. Independently convergent forms may later be standardised through recognition or authority.

The generative sequence is:

```
related functions -> overlapping command-worlds -> orientation -> survivable form -> retention
-> convergence and/or transmission -> standardisation
```

Standardisation is therefore not only imposed from above. It can grow from repeated local solutions. It can also be accelerated, selected, or enforced by a higher field.

7.4 Resemblance is not macro formation

Similarity alone does not create a higher macro object. Ten schools can resemble one another without jointly maintaining a district, ministry, or educational field.

A macro object forms when lower objects and relations jointly maintain a field-level function that no single lower object maintains alone. Shared records, funding relations, legal recognition, inspection systems, qualification standards, administrative dependencies, common categories, and authority relations can jointly maintain a higher field.

A higher macro object therefore has:

- 1 a field-level function;
- 2 lower objects and relations that maintain it;
- 3 a field-level physiology through which it holds;
- 4 an orientation against commands at its own level;
- 5 the capacity to enter relations under the full aspect architecture.

Macro formation is not a magical instant or a universal numerical threshold. It accretes through maintenance, recognition, dependency, retention, transmission, and standardisation until a field-level function is actually being held.

7.5 Macro return

Once the higher object holds, it is not merely a summary of its parts. It has the same aspect architecture as every object.

An education system is node from its own side, structure as a maintained field, frame when it reads schools, command when it bears on schools, and world when another object encounters it. Its orientation concerns commands at its own level: legitimacy, national performance, funding, labour demand, political pressure, law, competition, and administration.

The macro object can produce standards, targets, categories, inspections, funding rules, and reporting systems. These structures return as command for the lower worlds maintaining it.

Figure 2. Recursive macro accretion and macro return.

This is not simply bottom-up emergence followed by top-down control. Lower worlds maintain the macro object; the macro object occupies command-aspect in relation to those lower worlds; both remain nodes from their own sides.

7.6 Recursive maintenance

The complete movement is recursive:

```

local command -> local orientation -> retained form -> convergence/transmission -> macro
accretion -> macro orientation -> macro structure -> lower command-world -> renewed local
orientation
  
```

Every return changes the next cycle. Lower objects may reorganise, resist, recruit alternative structures, fragment, or build new macro relations. The macro may adapt, harden, displace cost, or collapse. CNPT therefore treats scale as ongoing relational maintenance, not as a completed hierarchy.

8. Stability, Hollow Stability, Collapse, and Fragmentation

8.1 Stability

Stability means the relevant command-shaped form and function still hold because maintenance still holds.

Stability does not mean no movement, no command, no cost, or no internal change. From outside, structure appears standing; from inside, maintenance continuously carries it.

Stability is always indexed to a function, level, and time. A body can be stable as a living organism while unstable in a particular organ. A school can be stable as a legal institution while unstable as an educational function. A theory can be stable as a published text while unstable as an explanatory system.

8.2 Hollow stability

Hollow stability is divergence between outside structural continuity and inside maintenance.

The structure still appears held while the maintenance underneath is being spent, damaged, overloaded, displaced, reorganised, or broken. A school still operates while teachers and students are drained. A body still functions while compensation damages lower systems. A state appears orderly while households or excluded groups carry the cost. A theory still explains everything while preventing correction from reaching its distinctions.

Hollow stability is not merely hidden weakness. It is a specific relation in which the visible macro form continues because lower maintenance absorbs a cost that the standing form does not display.

8.3 Collapse

Collapse occurs when constitutive maintenance can no longer hold the specified function and command-shaped form at the macro level being analysed.

Collapse is not object disappearance. Material, names, routines, people, records, and lower structures can remain after the macro function fails.

CNPT identifies three collapse dynamics.

Constitutive utility failure

A frame whose reading participates in maintaining the field no longer reads the function as viable, and that derecognition breaks the constitutive relation.

Not every observer is constitutive. A frame is constitutive only where its reading is part of what keeps the function standing at that level. University recognition may constitute student-function in a university field. A stranger's opinion does not.

Physiology change

The object's maintenance reorganises around a different function.

The object can remain visible and retain its name while no longer maintaining the same function. A school organised around education can reorganise around metric production. A theory organised around clarification can reorganise around self-protection. The standing shell continues, but the earlier function has collapsed by transformation.

Ordinary command-bearing can change physiology while preserving function. Collapse by physiology change occurs only when the maintained function itself changes.

Full maintenance failure

Maintenance no longer holds the relevant structure or function at that level. A body dies. A school closes or ceases to hold as school-field. A theory is no longer maintained as a living explanatory system.

Figure 3. Collapse at one level and continuation beneath it.

8.4 Fragmentation

Macro collapse is absolute at the macro level where the constitutive maintenance relation fails. Lower maintenance worlds do not necessarily collapse with it.

Fragmentation is local continuation beneath an absolute macro collapse.

A school can collapse while teachers, students, routines, documents, friendships, buildings, methods, and habits continue and re-anchor elsewhere. A theory can collapse while distinctions, examples, and problems survive in another theory. A state can collapse while local institutions, infrastructures, identities, records, and practices remain.

Fragmentation is not partial macro collapse. The macro function has failed. What continues are objects that were never only the macro field they helped maintain.

8.5 Re-anchoring

Fragments can enter new relations. A routine can be adopted by another institution. A legal record can be recognised by a successor state. A conceptual distinction can become structure in another theory.

Re-anchoring does not restore the collapsed macro object automatically. It shows that maintenance at one level can continue after failure at another and can become material for new formations.

9. Recognition, Power, and Displaced Maintenance Cost

9.1 Recognition

Recognition becomes command where it bears survival-relevantly on what an object maintains itself as.

Being named, denied, seen, included, excluded, classified, misread, praised, humiliated, legalised, or delegitimised can change structure, orientation, maintenance cost, utility reading, and identity.

Recognition may be constitutive of a field-held function. A student must be recognised as a student for student-function to hold in a school-field. A citizen must be recognised as a citizen for citizen-function to hold in a state-field.

Misrecognition is not merely an incorrect opinion. Where it bears on maintenance, it is command that forces the object to hold under a frame reading its function wrongly. The focal object's own orientation and the external utility reading can then diverge sharply.

9.2 Power

Power is asymmetric command under unequal reciprocal exposure.

An object or macro field has power where it structures another object's command-world while protecting its own maintenance from equivalent command in return.

A school structures time, grades, sanctions, progression, recognition, and legitimacy for students. A state structures law, money, borders, rights, records, policing, and recognition for citizens. A dominant frame can determine which function counts, which evidence becomes command, and which orientation is ignored.

Power does not require one-way causation. The less powerful object may still command the more powerful one through resistance, refusal, labour, exit, public exposure, or failure to maintain the field. The asymmetry lies in exposure, consequence, and insulation, not in total absence of reciprocity.

9.3 Displaced maintenance cost

A macro field can preserve its visible structure by pushing maintenance cost into lower worlds.

A school preserves metrics by displacing cost into teachers and students. A firm preserves profit by displacing cost into workers. A state preserves order by displacing cost into households, bodies, institutions, or excluded groups. A family preserves its image by making one member carry contradiction.

Extraction describes some cases, but the more general mechanism is displaced maintenance cost:

higher structure holds -> maintenance burden is displaced -> lower world pays

Where lower worlds continue holding under damaging cost, the macro can appear stable while becoming hollow.

9.4 Power and visibility

Power also shapes which level is visible. A macro frame can read its own continuing outputs as proof of stability while treating lower exhaustion as private failure. CNPT reverses that narrowing by tracing the maintenance relation across levels.

This does not mean every lower cost invalidates the macro function. All persistence has costs. The analytic question is whether the cost is being borne, whether it is constitutive, whether it is sustainable, and whether the standing macro form depends on concealing or misclassifying the condition of its maintainers.

10. Correction, Delusion, and Reflexivity

10.1 Correction

Correction is command capable of changing how a structure is maintained.

Correction is not merely information. It matters when evidence, pain, contradiction, failure, another frame, a lower maintenance world, the body, or social consequence bears survival-relevantly on the object.

A stable structure can take correction and preserve function through reorganisation. Correction can change physiology, recruit new structure, alter orientation, or expose that a former utility reading no longer holds.

Correction is not automatically destructive. It can be the command through which function survives.

10.2 Delusion

Delusion is hollow stability in a cognitive or interpretive frame.

A delusional structure may feel clear, reduce anxiety, preserve identity, and explain everything, but it does so by preventing correction from reshaping it. Contradiction becomes proof, denial becomes confirmation, and absence becomes hidden presence.

The same architecture can occur in a person, theory, ideology, institution, family, or state. The defining relation is not simple falsehood. It is maintained coherence purchased by blocking survival-relevant correction.

10.3 Reflexive application

CNPT is itself an object.

It is node from its own side because theory-function is at stake in its distinctions. It is structure as a formed account. It is command when it bears on another theory, reader, institution, or problem. It is frame when it reads a case. It is world when another object encounters it. It is macro relative to the concepts and examples maintaining it and micro relative to any field it helps sustain.

CNPT can grow, become hollow, change physiology, fragment, or collapse. Its function in this edition is clarification: to preserve a coherent architecture capable of receiving command from cases, criticism, contradiction, and evidence. If its organisation shifts from clarification to protection from correction, the text may remain while the theory-function changes.

Reflexivity does not place CNPT outside its own claims. It places the theory inside the same world of command and maintenance that it analyses.

11. Formal Schema

11.1 Base notation

Let Obj be the base type. Let F denote a specified function, L a level of analysis, R a relation, and t a time.

For any object O , $O[a]$ means O read under aspect a , where:

a in {node, command, structure, frame, world, orientation, utility, micro, macro}

The terms physiology, function, maintenance, potential, and history describe organisations or relations within the architecture. They do not enlarge the aspect set.

$Command(C, N, F, L, t)$ holds when object C bears survival-relevantly on node N 's maintained function F at level L and time t .

$Maintains(M, O, F, L, t)$ holds when object or relation M contributes constitutively to O continuing as function F at level L and time t .

$Frame(Q, O, F, L, t)$ indicates that object Q reads O 's function F from Q 's position.

$Orientation(O, F, L, t)$ denotes O 's total resolved own-side physiological position against actual command at that level and time.

$Utility(Q, O, F, L, t)$ denotes Q 's frame-side reading of the same functional relation.

$Potential(A, B, L, t)$ denotes the range of encounter-shapes compatible with the physiologies of A and B before actual command resolves a determinate shape.

11.2 Axioms

Axiom 1: Object-aspect unity

Aspect-position changes the relational reading of an object; it does not create a new substance or replace the object.

Axiom 2: Universal own-side nodehood

For every object O , $O[node]$ exists from O 's own maintenance position.

Axiom 3: Relational determination of aspect

An aspect-reading holds only where the stated relation, function, level, and physiology support it. Aspect is perspectival but not freely assignable.

Axiom 4: Command relevance

$Command(C, N, F, L, t)$ holds only where C bears on the continuation of F for N at L . Contact without such bearing is not command in that relation.

Axiom 5: Directionality

$Command(C, N, F, L, t)$ does not imply $Command(N, C, F, L, t)$. Where the reverse relation also holds, it does not imply equal effect, exposure, or maintenance cost.

Axiom 6: Relational command-shape

The shape carried by N is determined through the encounter between C 's bearing and N 's physiology, not by either object in isolation.

Axiom 7: Two routes of bearing

N carries command through direct physiological shape, mediated structure that it builds, finds, or uses, or a combination of the two.

Axiom 8: Retained command

Where a command-shaped form remains maintained, the earlier bearing persists as active present organisation even if the original contact ends.

Axiom 9: Functional identity

Identity at L is judged by continuity of the specified maintained function F at L.

Axiom 10: Positional function-reading

Orientation and utility are readings of the same functional relation from the object's own side and another object's frame respectively.

Axiom 11: Maintenance relativity

Where A maintains B's function, A is micro relative to B and B is macro relative to A in that relation.

Axiom 12: Macro accretion

A higher macro object holds where lower objects and relations jointly maintain a field-level function with field-level physiology, orientation, and relational capacity.

Axiom 13: Level-specific collapse

Collapse occurs where constitutive maintenance of the specified function fails at the level under analysis. Lower objects may continue from their own node positions.

11.3 Derived propositions

Retained-history proposition: present organisation can carry the active history of earlier bearing without the original contact remaining present.

Path-alteration proposition: a retained command-shape changes the physiology or structure through which later commands will be borne.

Asymmetric-reciprocity proposition: two objects may command one another in one encounter while carrying radically unequal effects and maintenance costs.

Observer-participation proposition: a frame is itself an object, and its act of reading can become command where that reading bears on the focal function.

Convergence proposition: related objects under overlapping command-worlds can generate similar forms without direct copying or top-down imposition.

Transmission-variation proposition: a transmitted form is re-determined through the receiving node's physiology and need not remain identical to its source.

Macro-return proposition: a macro object maintained by lower worlds can produce structures that become command for those same lower worlds.

Hollow-stability proposition: visible structural continuity does not entail intact maintenance.

Power-insulation proposition: power increases where an object can shape another's command-world while insulating its own maintenance from reciprocal bearing.

Fragmentation proposition: absolute macro collapse is compatible with local continuation and re-anchoring of lower maintenance worlds.

Correction proposition: command that reorganises maintenance can preserve function, expose hollow stability, or force functional transformation.

11.4 Compact dependency map

If this is specified	It determines or constrains
Object, function, and level	What counts as nodehood, identity, survival, stability, and collapse
Actual bearing relation	What counts as command and in which direction
Node physiology	Which command-shapes are possible and how they are carried
Maintained shape	Which history remains active and what later command encounters
Own-side position	Orientation
Another object's reading	Utility
Direction of maintenance	Micro and macro positions
Joint field-level maintenance	Macro formation
Divergence between outer structure and inner maintenance	Hollow stability
Failure of constitutive maintenance	Collapse at the specified level
Continuation below failed macro function	Fragmentation

12. Worked Analyses

The examples below use the same architecture. They do not introduce separate mechanisms for physical, biological, social, or conceptual cases.

12.1 Rock and ground

Rock and ground are distinct objects. From the rock's side, ground occupies command-aspect where support, angle, pressure, friction, or instability bears on the rock's held form. The rock's orientation is its physiology resolved against this command-world. Its resting position, deformation, fracture, or movement carries ground-shape.

From the ground's side, the rock can occupy command-aspect. Its weight and contact alter compression, displacement, or fracture in the ground. The encounter is reciprocal but need not be symmetric.

The ground is not inside the rock, but its bearing persists in the rock's position and shape. The rock is not the ground, but its bearing persists in the ground. A geologist's account is a frame-side calculation of a relation already determined object-side through contact.

The unfinished whole is the rock-ground encounter considered under the range of positions, fractures, displacements, and rests made possible by their physiologies before one shape is forced. Once the rock settles or breaks, command is carried in an actual form.

12.2 Body, shelter, and technology

A body faces hunger, fatigue, illness, injury, desire, shame, temperature, pain, threat, and rest. It bears command directly through scar, muscle, posture, stress-pattern, habit, hormonal change, pain-pattern, and adaptation.

It can also recruit structure. Clothing carries temperature command. Shelter carries weather command. Medicine changes physiology and the range of bearable forms. A calendar carries timing command. A mobility device changes the body's relation to distance and built space.

Technology does not erase the body's nodehood or replace command with an external solution. It becomes mediated structure through which the body's orientation can move into a larger range of maintained forms.

The body is macro relative to organs and cells that maintain it and micro relative to social worlds it helps maintain. Death is full maintenance failure at the body macro level. Lower tissues, traces, memories, records, and social effects may continue as fragments, but body-function has collapsed.

12.3 School and education system

A school is node from its own side and command to students and teachers where it structures time, attendance, recognition, assessment, and progression. Inspection, funding, legitimacy, regulation, coordination, and educational demand become command to the school.

The school carries them through physiology - staffing patterns, workload, culture, authority, and defensive routines - and through structure - timetables, classrooms, grades, policies, records, and sanctions.

Similar schools facing related problem-spaces can independently converge on or copy survivable forms. Resemblance alone does not create an education system. A higher macro object forms only where shared legal recognition, records, funding, qualifications, administration, and authority jointly maintain a field-level education function.

That macro object's standards, targets, inspections, and funding rules return as command to schools. Schools then reorganise, teachers absorb workload, students absorb stress, and bodies absorb exhaustion. If the field preserves visible outputs by displacing maintenance cost downward, it can become hollowly stable while remaining operational.

If the education field collapses, individual schools, teachers, methods, records, or buildings may continue and re-anchor. Their continuation is fragmentation beneath macro failure, not proof that the former field still holds.

12.4 Identity and recognition

Identity is a maintained function rather than substance or label alone. From the person's own side, identity has orientation. Social, legal, institutional, bodily, and interpersonal frames read utility and recognition.

Recognition can support a field-held identity-function. Misrecognition can become command that raises maintenance cost, blocks access, or forces additional structure. A frame is constitutive only where its reading participates in maintaining the identity-function at the level being analysed.

Self-maintained identity, legal identity, role identity, bodily function, and social recognition can therefore diverge without being collapsed into one. A hostile frame can have power over legal or institutional function without thereby becoming the source of the person's own-side orientation.

The case demonstrates why CNPT requires both orientation and utility. Orientation alone cannot explain field-held recognition. Utility alone erases the object's own maintenance position.

12.5 Theory

A theory is node from its own side and structure as a maintained distinction-system. Evidence, contradiction, rival explanations, examples, criticism, and misuse become command where they bear on theory-function.

A stable theory can take correction while preserving clarification. A hollow theory protects outward coherence by preventing correction from reaching maintenance. If it reorganises around self-protection rather than clarification, it collapses by physiology change even while its text and name remain.

Its distinctions and examples can survive as fragments elsewhere. A concept retained by another theory is re-anchored structure; it does not automatically restore the collapsed whole.

CNPT's own application to itself is therefore not decorative. It follows from universal own-side nodehood and the fact that theories have physiology, function, maintenance, frames, and command-worlds.

13. Derived Extension: The Ego-God Projection Framework

This section presents a derived application of CNPT to reflexive ego-systems. It is not a new primitive inside the core architecture. It shows how the same relations can generate a higher operating frame.

13.1 Ego-system

An ego-system is a reflexive node capable of organising experience, knowledge, identity, action, and reality-contact into an operative orientation.

As node, the ego-system meets command through its physiology, history, available knowledge, social world, and current pressures. When its existing frame can no longer hold sufficient coherence, it may reorganise available material into a higher-order projection.

13.2 God-move

A **God-move** is a local, partial, constructed move through which an ego-system places a pressure, contradiction, or uncertainty under a higher organising frame.

The move is not merely an idea added to the system. It is orientation moving into interpretive structure. It tells the system what the pressure means, what has authority, which commands dominate, and how continuation remains possible.

A God-move can recruit religious language, science, politics, personal mythology, family structure, moral law, metaphysics, status, nation, destiny, or another available form. The external material is not automatically the operative God. The operative form is the material as metabolised through the ego-system's physiology and retained as command-shape.

13.3 God-framework

Repeated and integrated God-moves can form a **God-framework**: the ego-system's highest operative command-shape.

The term names a real functional position in ego organisation. It is not rhetorical decoration, and it does not require a supernatural claim. The God-framework is the highest frame under which lower meanings, identities, permissions, prohibitions, and explanations are organised.

Every ego-system does not necessarily possess such a framework. Avoidance by itself is not enough. A God-framework exists where local moves have integrated sufficiently to operate as a highest organising whole.

The framework remains an unfinished whole. It can be organised enough to operate as one while remaining incomplete, revisable, internally uneven, or open to further fact-contact.

13.4 Overlay, contradiction, and fragmentation

God-frameworks can overlay earlier structures rather than replacing them cleanly. New material can reinterpret old doctrine, childhood authority, social identity, scientific knowledge, or personal experience. Contradictory regions can remain active at different times or under different commands.

An existing framework can therefore be fragmented, contradictory, or avoidant in some of its strategies. This differs from a system that has only avoidance and no integrated highest frame. The first has a weakly or unevenly maintained God-framework; the second has not formed one.

13.5 Operator quality and functional total coherence

The strength of a God-framework depends on the quality of the operator that constructs and maintains it.

Operator quality concerns the ego-system's capacity to make distinctions, integrate fact-contact, revise structure, preserve useful lower functions, and act under pressure.

Functional total coherence is not mere internal consistency. It is the degree to which the highest frame can organise the system's actual functions across situations while remaining in contact with reality.

Relevant dimensions include:

- predictive reach;
- adaptive capacity;
- update-capacity;
- viability under command;
- integration across lower functions;
- ability to absorb correction without total disorganisation;
- continued contact with fact.

Knowledge and intelligence are tools in this construction, but neither is sufficient alone. A knowledgeable system can protect a hollow frame more efficiently. An intelligent system can rationalise contradiction. Quality depends on how the tools are organised under command and whether correction can still reach the framework.

13.6 Reality-contact and lag

Reality enters the framework as fact-contact: bearing that is not created by the projection itself.

Reality is the ultimate arbiter in the limited sense that a framework which repeatedly fails to carry actual command will lose viability, change physiology, become hollow, fragment, or collapse. The arbitration can be delayed. Social power, insulation, borrowed maintenance, or displaced cost can allow a poor framework to continue for a long time.

Lag matters because immediate survival does not prove truth, and immediate defeat does not prove total falsity. A framework can be locally protected while accumulating maintenance failure elsewhere. The relevant judgement concerns total functional coherence across time and levels.

13.7 Tournament of Gods

The **Tournament of Gods** is the competition among ego-systems and enacted God-frameworks under shared reality-pressure.

The tournament is not only an argument between stated beliefs. Frameworks act through institutions, identities, technologies, bodies, norms, and command-worlds. They recruit maintenance, displace cost, produce structures, and reshape which facts can reach which nodes.

Power can protect a framework from correction and impose its utility reading on others. Yet imposed dominance is not identical to operator quality or functional total coherence. The tournament remains open wherever reality-contact, rival frames, lower maintenance worlds, or internal contradiction continue to bear on the system.

13.8 CNPT mapping

The extension maps onto CNPT as follows:

Ego-God term	CNPT position
Ego-system	Reflexive node with symbolic and interpretive physiology
Pressure or coherence failure	Command bearing on ego-function
God-move	Local orientation moving into higher-order interpretive structure
God-framework	Highest operative command-shape maintained by the ego-system
External doctrine or source	World-material recruited, metabolised, and restructured
Operator quality	Capacity of physiology to determine, integrate, and revise viable form
Functional total coherence	Cross-level maintenance of ego-system functions under actual command
Reality-contact	Fact becoming command through consequence
Tournament of Gods	Competing macro and micro frame-command systems under shared pressure

This mapping preserves the distinction between the general architecture and its application. CNPT explains how a highest frame can form, persist, gain power, block correction, or collapse. The Ego-God Projection Framework specifies one kind of reflexive object and one kind of macro organisation inside that architecture.

13.9 Descriptive and normative layers

The extension is descriptive before it is normative. It explains how highest operating frames are constructed and maintained. It does not infer that a framework is good because it exists, true because it survives briefly, or morally superior because it wins power.

Normative judgement requires a stated frame and function. Truth claims require sustained fact-contact and update-capacity. Moral claims require their own explicit commitments. CNPT can analyse how those judgements are maintained without silently substituting one for another.

14. Final Synthesis

Every object can occupy every CNPT aspect: node, command, structure, frame, world, orientation, utility, micro, and macro. These are positions in relations, not separate kinds of entity.

Every object is node from its own maintenance side. Physiology names the node-side organisation through which it holds function and takes shape. Function names what continues. Identity is continuity of that function at the specified level. Maintenance is the holding through which the function continues.

Command is survival-relevant bearing-on. When an object bears on a focal node's maintained function, it occupies command-aspect. The resulting command-shape is relationally determined through the physiologies that meet. The node carries that shape directly in physiology or through structure it builds, finds, or uses.

Maintenance keeps the command-shaped form holding. The command therefore persists in present organisation. History is active where earlier bearing survives as current physiology, structure, or command-world.

World is object as encountered from a focal node's survival position. Command topology is the derived organisation of actual command relations, not a pre-given background law.

Orientation is the object's total real-time position against command from its own side. Utility is the same function read from another frame. Neither is neutral, and neither can replace the other.

Growth is orientation moving into retained form. Retention changes what later commands meet. Similar objects under related command-worlds can independently converge on or transmit survivable forms. Standardisation can emerge locally, be transmitted horizontally, or be organised by higher fields.

When lower objects and relations jointly maintain a field-level function that no single lower object maintains alone, a macro object accretes. It has its own physiology, orientation, command-world, and aspect relations. It can return through structures that become command to the lower worlds maintaining it.

Stability means maintenance still holds the relevant function and form. Hollow stability means the standing form remains while maintenance underneath is being spent, damaged, displaced, or reorganised. Power is asymmetric command under unequal reciprocal exposure. A powerful field can preserve visible structure by displacing maintenance cost downward.

Collapse occurs through constitutive utility failure, physiology change around another function, or full maintenance failure. Macro collapse is absolute at the failed level. Fragmentation is the continuation and possible re-anchoring of lower objects beneath it.

Correction is command capable of changing how structure is maintained. It can preserve function, expose hollow stability, or force transformation. Delusion is maintained cognitive coherence that blocks correction from reaching the structure.

CNPT is itself subject to these relations. It persists only while its distinctions continue to function under cases, criticism, contradiction, and evidence.

The framework's smallest relation is directional: command bears on node. Its central mechanism is command-shape. Its criterion of identity is function. Its engine of persistence is maintenance. Its own-side position is orientation. Its frame-side reading is utility. Its scale relation is micro and macro. Its generative movement is retention, convergence, macro accretion, and macro return. Its failure relations are hollow stability, transformation, constitutive utility failure, full maintenance failure, and fragmentation.

Everything that holds is holding against something. CNPT names the positions, forms, costs, histories, and levels through which that holding becomes a world.

Glossary

Term	Concise definition
Object	Whatever stands as one within relations at the level being analysed
Node	Object from its own maintenance position
Command	Object as survival-relevant bearing-on another object's function
Command-field	The active set of command relations for a focal node, function, and level
Command topology	The derived organisation of those active relations
Command-shape	The form through which bearing is carried in physiology or structure
Structure	Standing maintained form, static from outside and maintained from inside
Frame	Object as reader of another object from its own position
World	Object as encountered from a focal node's survival position
Physiology	Node-side organisation through which an object takes shape and holds function
Function	What the object maintains itself as at the stated level
Identity	Continuity of the specified function at that level
Maintenance	Ongoing holding through which command-shaped function continues
Orientation	Total resolved own-side position of physiology against actual command
Utility	The same functional relation read from another object's frame
Potential	Encounter-shapes compatible with physiology but not yet forced by actual command
Unfinished whole	The encounter read under unresolved but constrained form
Growth	Orientation moving into retained physiology or structure
Retention	Maintenance of command-shaped form across time
Micro	Object as contributing to another object's maintenance
Macro	Object as maintained by lower objects or relations
Macro accretion	Formation of a field-level object through joint lower maintenance
Macro return	Higher structure becoming command to lower worlds maintaining it
Stability	Continued maintenance of the specified function and form
Hollow stability	Outer structural continuity with damaged, displaced, or failing inner maintenance
Recognition	Frame-reading that becomes command where it bears on maintained function
Power	Asymmetric command under unequal reciprocal exposure
Displaced maintenance cost	Preservation of a higher form by shifting burden into lower worlds
Correction	Command capable of reorganising how a structure is maintained
Delusion	Hollow cognitive stability maintained by blocking correction
Collapse	Failure of constitutive maintenance at the specified macro level
Fragmentation	Local continuation beneath absolute macro collapse
